

```

function K = MTGP_covCC_chol_nD(hyp,x, z, i)
%
% Generates a "free-form" cross correlation covariance matrix as proposed
% by Bonilla et al. 2007 using a Cholesky decomposition to assure that the
% matrix is positive definite
%
% hyperparameters are the elements of the lower triangula matrix L in the order
% of:
%
%      theta_c,1      0      0      0
%  L   = [ theta_c,2      theta_3      0      ...      0      ]
%
%      ...
%      theta_c,k-m+1  theta_c,k-m+2  theta_c,k-m+3  ...  theta_c,k
%
% Parametrization is as discribed "Tutorial on Multi-Task Gaussian
% Processes for biomedical applications"
%
% Only elements of x(:,end)/z(:,end) will be analyzed, residual columns will be ✓
% ignored.
% x(:,end)/z(:,end) contain the label information of the feature
%
% Derivatives are implemented and hypperparameters can be optimized via gradient ✓
% descent
% (So far only tested up to nL 4)
%
% by Robert Duerichen
% 04/02/2014
%
